ACC

Analytics Career Connect

Become Corporate Job-Ready Data Analyst

Master All Practical Corporate Activities to Become Job-Ready

Excel | SQL | Power BI | Tableau | Python

Real Industry Simulation | Interview Preparation | Portfolio Building

Wasim Patwari

Founder, Analytics Career Connect

Data Analyst & Consultant

INDEX

1 Program Overview

1.1 Purpose of the Practical Job-Ready Data Program
1.2 Who This Program Is For (Interns & Aspiring Candidates)
1.3 Activity-Based Corporate Learning Approach
1.4 Business Domains Covered
1.5 Job-Readiness Objective

2 Tools Wise – Industry Level Activity Mastery

2.1 Excel – Corporate Reporting Mastery

2.1.1 Excel in Corporate Data Environment
2.1.2 Core Capabilities of an Excel Master
2.1.3 Data Cleaning & Preparation Activities
2.1.4 Formula & Logical Structuring Activities
2.1.5 Reporting & MIS Automation Activities
2.1.6 Dashboard & Visualization Activities
2.1.7 Financial & Business Analysis Activities
2.1.8 Advanced Analytical Activities
2.1.9 Automation & Optimization Activities
2.1.10 Industry Simulation Activities
2.1.11 Industry Outcome After Excel Mastery

2.2 SQL – Database & Business Query Mastery

2.2.1 SQL in Modern Data Systems
2.2.2 Core Capabilities of an SQL Master
2.2.3 Data Extraction & Query Writing Activities
2.2.4 Multi-Table & Relational Activities
2.2.5 Aggregation & KPI Reporting Activities
2.2.6 Advanced Query Logic Activities
2.2.7 Data Validation & Quality Control Activities
2.2.8 Performance & Optimization Activities
2.2.9 Industry Simulation Activities
2.2.10 Industry Outcome After SQL Mastery

2.3 Power BI / Tableau – Business Intelligence Mastery

2.3.1 Role of BI in Corporate Decision-Making
2.3.2 Core Capabilities of a BI Professional
2.3.3 Data Import & Integration Activities
2.3.4 Data Transformation & Cleaning Activities
2.3.5 Data Modeling & Architecture Activities
2.3.6 Measure & Calculation Development Activities
2.3.7 Dashboard Design & Visualization Activities
2.3.8 Advanced Analytical Visualization Activities
2.3.9 Automation & Performance Activities
2.3.10 Security & Governance Activities
2.3.11 Stakeholder Presentation & Simulation Activities
2.3.12 Industry Outcome After BI Mastery

2.4 Python – Advanced Data Handling & Analytical Mastery

2.4.1 Python in Corporate Data Ecosystem
2.4.2 Core Capabilities of a Python Data Professional
2.4.3 Data Loading & Preparation Activities
2.4.4 Data Manipulation & Analysis Activities
2.4.5 Exploratory Data Analysis (EDA) Activities
2.4.6 Data Visualization Activities
2.4.7 Automation & Workflow Activities
2.4.8 Web Scraping & Data Collection Activities
2.4.9 Statistical & Experimentation Activities
2.4.10 Predictive Modeling Activities
2.4.11 Industry Simulation Activities
2.4.12 Industry Outcome After Python Mastery

3 General Industry Readiness Activities

3.1 Web Scraping – Real-World Data Collection
3.2 A/B Testing – Experimentation & Decision Analysis
3.3 End-to-End Data Pipeline Simulation
3.4 Data Quality Audit
3.5 Competitor Data Benchmarking
3.6 Business Forecasting Project
3.7 Time-Series Trend Study
3.8 Anomaly Detection Project
3.9 Data Storytelling & Presentation Skills
3.10 Portfolio & Professional Branding Activities
3.11 Interview Simulation Activities
3.12 Corporate Workflow & Team Simulation
3.13 Industry Outcome After Readiness Completion

Program Overview

The **Practical Job-Ready Data Domain Program** is designed to transform interns and aspiring data professionals into industry-ready candidates through structured, real-world, activity-based execution.

This program is created not only for interns, but also for any candidate who wants to become job-ready in the data domain and confidently step into corporate roles.

This is not a theory-based course. This is not just tool training. This is a corporate simulation framework built around real company-level data work.

Every activity inside this program mirrors practical business scenarios handled by data professionals in real organizations. Participants do not simply learn tools — they work on structured activities that simulate reporting, analytics, performance tracking, and decision-making environments.

The framework emphasizes:

- Practical execution over memorization
- Real datasets over sample examples
- Business understanding over mechanical tool usage
- Insight generation over basic reporting
- Corporate workflow simulation over academic learning

Participants develop the capability to work across key business domains including:

Sales | Finance | Marketing | HR | Product Analytics

By completing this program, an intern or candidate becomes capable of:

- Understanding business problems and translating them into data tasks
- Working with large structured and unstructured datasets
- Extracting and transforming data from databases
- Building corporate dashboards and automated reports
- Performing analytical and statistical evaluation
- Generating meaningful business insights
- Presenting findings confidently in interviews and corporate settings

The goal of this framework is clear:

To make interns and aspiring candidates fully job-ready, capable of independently handling real corporate data responsibilities with confidence and professionalism.

Excel – Corporate Reporting Mastery

Excel remains one of the most powerful and widely used tools in the data domain. Across startups, mid-size companies, and large enterprises, Excel is still the backbone of reporting, analysis, budgeting, operations tracking, and decision support.

Mastering Excel at an industry level means far more than knowing formulas. It means developing the ability to handle raw data, structure it correctly, analyze it meaningfully, and present it professionally.

Within this framework, Excel mastery is built through execution of real corporate-level activities such as large dataset cleaning, MIS automation, KPI dashboard creation, financial tracking, cohort analysis, performance reporting, forecasting, and optimization modeling.

An Excel Master in the data domain should be capable of:

- Handling datasets with thousands of rows confidently
- Cleaning, structuring, and validating raw business data
- Building automated reporting systems
- Designing dynamic KPI dashboards
- Creating revenue, profitability, and cost analysis models
- Performing sales, HR, and operational performance tracking
- Conducting trend analysis and forecasting
- Applying What-If scenarios for decision support
- Building executive summary sheets for management
- Optimizing heavy Excel files for performance and scalability

Excel mastery develops core analytical thinking. It teaches how business metrics connect, how data flows through departments, and how decisions are supported through structured reporting.

In many organizations, Excel is used for:

- Monthly and quarterly MIS reporting
- Financial planning and budgeting
- Revenue and expense tracking
- Marketing performance measurement
- HR analytics and employee performance tracking
- Operations monitoring
- Strategic forecasting

When an intern achieves true Excel corporate mastery, they become capable of independently handling reporting responsibilities across multiple departments without constant supervision.

Excel mastery also builds a strong foundation for advanced tools like SQL, Power BI, and Python. It strengthens data logic, analytical structure, and reporting clarity — skills that transfer directly into higher-level data roles.

After mastering Excel at this level, a candidate can confidently work in roles such as:

- MIS Executive
- Data Analyst (Entry-Level)
- Business Reporting Analyst
- Operations Analyst
- Financial Data Executive
- HR Data Analyst

Below are the core industry-level activities required to achieve Excel Corporate Mastery.

1️⃣ Data Cleaning & Preparation Activities

- Clean large datasets (10,000+ rows)
- Remove duplicates
- Handle missing values
- Standardize date formats
- Normalize categorical data
- Data type correction
- Error detection & correction
- Outlier identification
- Text transformation & cleaning
- Data splitting & merging
- Data validation rule setup
- Master data sheet creation
- Data consolidation from multiple sheets
- Data import from CSV, TXT, and external sources
- Data structuring for analysis

2 Formula & Logical Structuring Activities

- Advanced lookup implementation (VLOOKUP, XLOOKUP, INDEX-MATCH)
- Conditional logic modeling (IF, nested IF)
- Error handling logic (IFERROR)
- Conditional aggregation (SUMIF, COUNTIF, AVERAGEIF)
- Multi-condition logic modeling
- Date-based calculations
- Ratio and percentage calculations
- Dynamic formula building
- Cross-sheet data referencing
- Scenario-based formula structuring

3 Reporting & MIS Automation Activities

- Build Daily MIS report
- Build Weekly MIS report
- Build Monthly MIS report
- Department-wise performance reports
- Automated summary sheets
- Revenue tracking sheets
- Expense tracking sheets
- Budget vs Actual reporting
- Sales performance reporting
- HR attendance & performance reports
- Operations monitoring reports
- Automated reporting templates
- Dynamic reporting models
- Executive summary sheet creation

4 Dashboard & Visualization Activities

- KPI dashboard creation
- Revenue vs Target dashboard
- Profitability dashboard
- Sales territory dashboard
- HR analytics dashboard
- Marketing performance dashboard
- Inventory tracking dashboard
- Interactive dashboards using slicers
- Drill-down dashboards
- Management-level presentation dashboards
- Visualization best practices implementation

---

5 Financial & Business Analysis Activities

- Profitability analysis
- Cost analysis
- Revenue growth analysis
- Contribution margin calculation
- Break-even analysis
- Variance analysis
- Budget forecasting
- Cash flow tracking
- Product performance analysis
- Customer profitability analysis
- Sales trend analysis
- Market performance tracking
- ROI analysis

6 Advanced Analytical Activities

- Customer cohort analysis
- Time-series trend analysis
- Growth rate calculation
- Forecasting using historical data
- What-If scenario analysis
- Sensitivity analysis
- Demand estimation models
- Risk assessment models
- Performance benchmarking
- Data-driven decision modeling

7 Automation & Optimization Activities

- Automated report generation models
- Macro-based repetitive task automation
- Data validation automation
- Performance optimization for large files
- Structured workbook architecture design
- Reusable reporting framework creation
- Error-proof model design

8 Industry Simulation Activities

- Simulate company monthly reporting cycle
- Build cross-department reporting system
- Present dashboard to management (simulation)
- Create client-ready Excel report
- Solve real business case study in Excel
- Handle real-world messy dataset simulation

Industry Outcome After Complete Excel Mastery

After completing all these activities, a candidate becomes capable of:

✔ Handling end-to-end reporting independently
✔ Managing large operational datasets
✔ Supporting finance, sales, HR, and operations teams
✔ Creating structured dashboards for decision-makers
✔ Performing profitability and forecasting analysis
✔ Automating business reports
✔ Working confidently in entry-level corporate data roles

SQL – Database & Business Query Mastery

SQL is the backbone of modern data systems. While Excel handles structured reporting, SQL handles the source of truth the database.

Across startups, mid-size companies, and enterprises, SQL is used to extract, filter, join, transform, and analyze raw data stored in company databases. Almost every Data Analyst, BI Analyst, or Data Scientist role requires SQL proficiency.

Mastering SQL at an industry level means more than writing SELECT statements. It means understanding data structures, relational logic, business metrics, and performance optimization.

Within this framework, SQL mastery is built through execution of real corporate-level activities such as multi-table reporting, KPI extraction, cohort analysis, churn identification, revenue tracking, validation checks, and database simulation.

An SQL Master in the data domain should be capable of:

- Extracting structured data from large relational databases
- Writing optimized queries for business reporting
- Joining multiple tables accurately
- Performing segmentation and aggregation
- Creating KPI-based query reports
- Detecting anomalies and inconsistencies
- Performing cohort and trend analysis
- Optimizing slow queries
- Validating data integrity
- Simulating real corporate reporting workflows

SQL mastery strengthens logical thinking, data modeling understanding, and business metric calculation core capabilities required in almost all data roles.

In many organizations, SQL is used for:

- Revenue and sales reporting
- Customer behavior analysis
- Marketing campaign analysis
- Financial performance tracking
- HR analytics extraction
- Product usage analytics
- Operations monitoring
- Strategic decision support

When an intern achieves true SQL mastery, they become capable of directly working with live company databases and generating reliable, structured insights.

SQL also builds a strong foundation for tools like Power BI, Tableau, and Python by strengthening query logic, data relationships, and aggregation thinking.

After mastering SQL at this level, a candidate can confidently work in roles such as:

- Data Analyst
- BI Analyst
- Database Analyst
- Business Intelligence Executive
- Product Analyst
- Marketing Data Analyst

Below are the core industry-level activities required to achieve SQL Corporate Mastery.

1️⃣ Data Extraction & Query Writing Activities

- Write structured SELECT queries
- Apply WHERE-based filtering
- Use ORDER BY and LIMIT effectively
- Extract data based on date conditions
- Query large datasets efficiently
- Retrieve specific business metrics
- Use DISTINCT for unique value extraction
- Create reusable query templates
- Perform conditional filtering

2️⃣ Multi-Table & Relational Activities

- Perform INNER JOIN
- Perform LEFT JOIN
- Perform RIGHT JOIN
- Join 3–5 tables for complex reports
- Create relational reporting queries
- Validate join accuracy
- Identify data mismatches between tables
- Create structured master reporting query

3 Aggregation & KPI Reporting Activities

- Use GROUP BY for summarization
- Calculate SUM, AVG, COUNT, MIN, MAX
- Build revenue summary reports
- Generate monthly growth reports
- Calculate conversion rates
- Create churn rate queries
- Build KPI calculation queries
- Generate customer segmentation reports
- Build performance ranking reports

4 Advanced Query Logic Activities

- Write nested subqueries
- Use CASE statements for conditional logic
- Apply window functions (ROW_NUMBER, RANK, DENSE_RANK)
- Perform running totals
- Create cohort analysis queries
- Detect duplicate records
- Identify missing records
- Perform anomaly detection queries
- Create time-based performance analysis queries

5 Data Validation & Quality Control Activities

- Create SQL validation checks
- Detect inconsistent values
- Identify null-heavy columns
- Validate revenue calculations
- Compare cross-table metrics
- Perform data audit queries
- Ensure reporting accuracy through validation logic

6 Performance & Optimization Activities

- Optimize slow-running queries
- Reduce unnecessary joins
- Apply indexing logic understanding
- Improve aggregation performance
- Structure queries for scalability
- Debug inefficient query structures

7 Industry Simulation Activities

- Simulate company revenue reporting system
- Build end-to-end SQL reporting workflow
- Extract data for BI dashboard integration
- Perform customer lifecycle analysis
- Solve real business case study using SQL
- Generate executive-ready KPI reports
- Handle real-world messy relational dataset

Industry Outcome After Complete SQL Mastery

After completing all these activities, a candidate becomes capable of:

✔ Working directly with company databases
✔ Extracting structured and reliable data
✔ Generating KPI-based business reports
✔ Performing segmentation and churn analysis
✔ Conducting cohort and growth analysis
✔ Supporting BI and dashboard teams
✔ Writing optimized and scalable queries
✔ Working confidently in corporate data environments

SQL mastery transforms a candidate from a spreadsheet user into a database-driven analyst.

It builds the core foundation required for serious data roles and is one of the strongest indicators of job readiness in the data domain.

Power BI / Tableau – Business Intelligence Mastery

Power BI and Tableau represent the visualization and decision-support layer of the data ecosystem. While SQL extracts data and Excel structures it, Business Intelligence tools transform data into actionable insights through interactive dashboards and visual storytelling.

Across startups, mid-size companies, and enterprises, BI tools are used by management teams to monitor performance, track KPIs, and make strategic decisions.

Mastering Power BI or Tableau at an industry level means more than building charts. It means designing structured data models, creating scalable dashboards, implementing performance tracking systems, and presenting insights with clarity and business understanding.

Within this framework, BI mastery is built through real corporate-level dashboard development, KPI monitoring systems, executive reporting design, automation, and stakeholder presentation simulation.

A Business Intelligence Master in the data domain should be capable of:

- Importing and managing data from multiple sources
- Transforming and cleaning data professionally
- Designing structured data models with relationships
- Creating calculated columns and performance measures
- Developing interactive and executive-level dashboards
- Implementing drill-down and dynamic reporting
- Designing performance monitoring systems
- Automating data refresh processes
- Simulating data security and access control
- Presenting insights in clear business language

BI mastery builds visualization thinking, business interpretation skills, and stakeholder communication capability which are critical for decision-support roles.

In many organizations, Power BI and Tableau are used for:

- Executive KPI monitoring
- Sales performance dashboards
- Financial performance tracking
- Marketing campaign analysis
- HR analytics reporting

- Operations monitoring
- Product usage tracking
- Strategic planning dashboards

When an intern achieves true BI mastery, they become capable of delivering management-ready dashboards that support real business decisions.

After mastering Power BI or Tableau at this level, a candidate can confidently work in roles such as:

- BI Analyst
- Data Analyst
- Business Intelligence Executive
- Reporting Analyst
- Performance Analyst
- Strategy Support Analyst

Below are the core industry-level activities required to achieve Business Intelligence Corporate Mastery.

1️⃣ Data Import & Integration Activities

- Import data from Excel
- Import data from SQL databases
- Import CSV and flat files
- Connect to cloud data sources
- Combine multiple datasets
- Merge queries
- Append queries
- Create centralized reporting dataset
- Handle incremental data loading
- Create reusable data connections
- Integrate historical and live data
- Perform cross-source integration
- Validate imported data accuracy

2️⃣ Data Transformation & Cleaning Activities

- Clean datasets using Power Query
- Remove duplicates
- Handle missing values
- Standardize formats
- Create calculated transformation columns
- Split and merge columns

- Create derived metrics during transformation
- Build structured data pipeline
- Remove inconsistencies
- Normalize categorical data
- Create automated transformation workflows
- Build refresh-safe transformation logic

3 Data Modeling & Architecture Activities

- Create table relationships
- Build star schema model
- Create fact tables
- Create dimension tables
- Design scalable data model
- Validate relationship cardinality
- Optimize model performance
- Create hierarchical structures
- Implement time intelligence tables
- Manage model dependencies
- Reduce redundant data
- Create centralized KPI layer

4 Measure & Calculation Development Activities

- Create calculated columns
- Create dynamic measures
- Build SUM, COUNT, AVERAGE measures
- Create percentage growth calculations
- Create Year-over-Year comparison
- Build Month-over-Month growth measures
- Create cumulative totals
- Implement ranking logic
- Create contribution analysis measures
- Build variance analysis measures
- Develop KPI threshold logic
- Create conditional formatting logic
- Build advanced DAX measures
- Implement time intelligence functions
- Create performance index scoring

5 Dashboard Design & Visualization Activities

- Design executive-level dashboard
- Create multi-page dashboard solution
- Build Sales dashboard
- Build HR dashboard
- Build Finance dashboard
- Build Marketing dashboard
- Build Operations dashboard
- Create inventory tracking dashboard
- Develop product performance dashboard
- Implement KPI cards
- Build drill-through pages
- Implement slicers & filters
- Design dynamic navigation
- Create mobile-optimized dashboards
- Use storytelling layout principles
- Apply visualization best practices
- Optimize user experience design
- Implement color-based performance indicators

6 Advanced Analytical Visualization Activities

- Cohort analysis dashboard
- Customer segmentation dashboard
- Funnel analysis dashboard
- Retention analysis dashboard
- Churn tracking dashboard
- Revenue forecasting visualization
- Time-series trend visualization
- Geographic analysis dashboard
- Territory performance map
- Performance benchmarking dashboard
- Target vs Achievement monitoring
- Real-time monitoring simulation

7 Automation & Performance Activities

- Implement automated data refresh
- Schedule refresh cycles
- Optimize dashboard loading speed
- Reduce model size
- Improve query performance

- Manage data gateway simulation
- Create scalable reporting architecture
- Implement incremental refresh logic

8 Security & Governance Activities

- Implement role-level security
- Create user-specific dashboard views
- Simulate department-level access control
- Validate secure reporting structure
- Test security logic
- Design secure data model architecture

9 Presentation & Stakeholder Simulation Activities

- Present dashboard to management
- Explain KPIs in business language
- Convert dashboard into executive summary
- Deliver business recommendation using dashboard
- Conduct stakeholder Q&A simulation
- Build client-ready dashboard
- Solve real business case via BI tool
- Convert Excel reports into BI dashboards
- Integrate SQL data into dashboard workflow

Industry Outcome After Complete BI Mastery

After completing all these activities, a candidate becomes capable of:

✔ Designing enterprise-level dashboards
✔ Building scalable and optimized data models
✔ Translating business requirements into visual KPIs
✔ Automating reporting systems
✔ Supporting leadership decision-making
✔ Delivering professional stakeholder presentations
✔ Working confidently in BI Analyst roles

Business Intelligence mastery transforms data into strategic visibility. It bridges raw database logic and executive decision-making. At this level, a candidate is not just creating charts they are designing performance monitoring systems used by management teams.

Python – Advanced Data Handling & Analytical Mastery

Python represents the advanced analytical layer of the data ecosystem. While Excel structures reports, SQL extracts data, and BI tools visualize insights Python enables automation, deep analysis, statistical modeling, and scalable data processing.

In modern organizations, Python is used for advanced analytics, automation workflows, forecasting, experimentation analysis, data engineering support, and machine learning applications.

Mastering Python at an industry level means more than writing scripts. It means handling complex datasets, performing structured analysis, building predictive logic, automating repetitive processes, and supporting strategic decision-making.

Below is the comprehensive industry-level activity framework required to achieve Python Corporate Mastery.

1️⃣ Data Loading & Preparation Activities

- Load data from CSV, Excel, SQL databases
- Read large datasets efficiently
- Merge multiple datasets
- Handle structured and semi-structured data
- Convert data types correctly
- Clean messy real-world datasets
- Handle missing values
- Remove duplicates
- Detect and treat outliers
- Normalize and standardize data
- Reshape and pivot datasets
- Create reusable data cleaning pipelines

2️⃣ Data Manipulation & Analysis Activities

- Perform filtering and grouping operations
- Create aggregated summaries
- Apply conditional logic
- Perform time-based data analysis
- Calculate KPIs programmatically
- Perform customer segmentation analysis

- Conduct profitability analysis
- Analyze product performance
- Calculate growth rates
- Conduct retention and churn analysis
- Build cohort analysis programmatically
- Perform correlation analysis
- Identify trends and seasonality

3️⃣ Exploratory Data Analysis (EDA) Activities

- Generate descriptive statistics
- Identify distribution patterns
- Detect anomalies
- Perform trend analysis
- Analyze categorical vs numerical relationships
- Create summary reports
- Document analytical findings
- Build automated EDA report templates

4️⃣ Data Visualization Activities

- Create line charts for trends
- Create bar charts for comparisons
- Create scatter plots for relationships
- Build histogram distribution analysis
- Visualize correlation matrices
- Build time-series visualizations
- Create dashboard-style visual summaries
- Generate automated visualization reports

5️⃣ Automation & Workflow Activities

- Automate monthly reporting tasks
- Create scheduled reporting scripts
- Automate Excel file generation
- Build data transformation automation
- Create data validation scripts
- Automate repetitive business calculations
- Build reusable analytical modules
- Simulate automated data pipeline

6 Web Scraping & Data Collection Activities

- Extract data from public websites
- Scrape structured tables
- Handle pagination
- Clean scraped data
- Store scraped data into structured format
- Build automated scraping scripts
- Simulate competitor data collection
- Validate scraped data quality

7 Statistical & Experimentation Activities

- Conduct A/B testing analysis
- Perform hypothesis testing
- Calculate statistical significance
- Analyze experiment results
- Perform regression analysis
- Conduct correlation testing
- Interpret statistical outputs
- Translate statistical results into business language

8 Predictive Modeling Activities

- Perform feature engineering
- Prepare training datasets
- Build regression models
- Build classification models
- Evaluate model performance
- Perform cross-validation
- Measure accuracy, precision, recall
- Build sales forecasting model
- Build churn prediction model
- Interpret model output for business use

9 Industry Simulation Activities

- Solve end-to-end business case using Python
- Build automated reporting system
- Conduct predictive sales analysis
- Perform customer behavior analysis
- Simulate real company dataset handling
- Present Python-based analysis findings

- Convert raw data into executive insight report
- Integrate SQL + Python workflow

Industry Outcome After Complete Python Mastery

After completing all these activities, a candidate becomes capable of:

✔ Handling complex structured and unstructured datasets
✔ Automating reporting and analysis processes
✔ Performing deep analytical reasoning
✔ Conducting A/B testing and statistical evaluation
✔ Building predictive models
✔ Supporting data-driven decision-making
✔ Working in Data Analyst, Product Analyst, or Entry-Level Data Scientist roles
✔ Operating confidently in advanced corporate data environments

Python mastery elevates a candidate from reporting-level work to analytical problem-solving and automation capability.

It represents the transition from data handling to data intelligence.

At this level, a candidate is not just analyzing past data — they are building systems that predict, automate, and optimize business outcomes.

General Industry Readiness Activities

Technical skills alone do not make a candidate job-ready.
Industry readiness requires problem-solving ability, communication skills, documentation discipline, structured thinking, and corporate simulation experience.

The following activities are designed to prepare interns and candidates for real-world data environments beyond tools and software.

1 Web Scraping – Real-World Data Collection

Interns must perform structured data extraction from live websites to simulate real market data collection.

Activities include:

- Extract structured data from public websites
- Scrape product pricing and competitor information
- Handle pagination and dynamic content
- Clean and structure scraped datasets
- Store data in analysis-ready format
- Automate scraping workflows
- Validate scraped data quality
- Use scraped data for analytical reporting

Industry Purpose:
Develop real-world data acquisition capability where datasets are not always provided.

2 A/B Testing – Experimentation & Decision Analysis

Interns must simulate business experiments and evaluate results statistically.

Activities include:

- Design experiment structure
- Define control and test groups
- Calculate conversion rates
- Perform statistical significance testing
- Compare performance metrics
- Interpret experiment outcomes

- Translate statistical results into business decisions
- Present experiment recommendation

Industry Purpose: Build data-driven decision-making mindset used in marketing, product, and growth teams.

3 End-to-End Data Pipeline Simulation

Interns must simulate full data lifecycle handling.

Activities include:

- Collect raw data
- Clean and validate dataset
- Store structured dataset
- Perform analysis
- Create dashboard/report
- Generate insight summary
- Present final business recommendation

Industry Purpose: Understand complete workflow from raw data to executive insight

4 Data Quality Audit

Interns must evaluate and validate data integrity.

Activities include:

- Identify duplicate records
- Detect missing values
- Validate metric calculations
- Perform cross-checking of KPIs
- Detect anomalies
- Ensure reporting accuracy
- Document quality issues
- Create audit summary report

Industry Purpose: Ensure data reliability in corporate reporting environments.

5 Competitor Data Benchmarking

Interns must analyze market-level data to compare performance.

Activities include:

- Collect competitor performance data
- Benchmark pricing models
- Compare growth metrics
- Analyze product positioning
- Create comparative dashboard
- Present strategic recommendations

Industry Purpose: Develop strategic analysis and market intelligence capability

6 Business Forecasting Project

Interns must predict future trends using historical data.

Activities include:

- Perform trend analysis
- Build forecasting model
- Estimate revenue projections
- Analyze seasonal patterns
- Evaluate forecast accuracy
- Create forecast presentation report

Industry Purpose: Support financial planning and strategy decisions.

7 Time-Series Trend Study

Interns must analyze performance over time.

Activities include:

- Monthly growth tracking
- Seasonal pattern detection
- Performance variance analysis
- Rolling average calculation
- Long-term trend interpretation
- Visual trend presentation

Industry Purpose: Understand long-term performance patterns and predict changes.

8️⃣ Anomaly Detection Project

Interns must detect unusual behavior in data.

Activities include:

- Identify outliers
- Detect unusual revenue spikes
- Analyze drop in performance
- Create anomaly detection logic
- Interpret anomaly causes
- Report findings with risk explanation

Industry Purpose: Strengthen risk monitoring and data validation skills

9️⃣ Data Storytelling & Presentation Skills

Interns must convert technical analysis into business communication.

Activities include:

- Create structured presentation slides
- Develop executive summary
- Explain KPIs in simple language
- Present analysis confidently
- Answer stakeholder-style questions
- Convert analysis into recommendations

Industry Purpose: Bridge gap between technical work and business understanding

🔟 Portfolio & Professional Branding Activities

Interns must build visible proof of capability.

Activities include:

- Document complete projects
- Create portfolio-ready case studies
- Publish projects on GitHub
- Structure professional README files
- Prepare resume-ready project descriptions

- Create LinkedIn project showcase
- Record project explanation videos

Industry Purpose: Make skills visible to recruiters and hiring managers.

11 Interview Simulation Activities

Interns must simulate real hiring process.

Activities include:

- Mock technical interview
- SQL and analytical problem solving
- Dashboard explanation round
- Case study discussion
- HR behavioral interview
- Resume walkthrough simulation
- Confidence and communication practice

Industry Purpose: Prepare for real interview pressure and questioning patterns.

12 Corporate Workflow & Team Simulation

Interns must experience collaborative data work.

Activities include:

- Weekly reporting simulation
- Deadline-based task execution
- Team-based data project
- Role allocation (Analyst, Reviewer, Presenter)
- Cross-functional reporting
- Client-style requirement understanding
- Iterative feedback implementation

Industry Purpose: Prepare for structured corporate environments and teamwork culture.

Industry Outcome After Completing General Industry Readiness Activities

After completing these activities, an intern or candidate becomes capable of:

✔ Handling data beyond tools
✔ Solving real business problems

✔ Communicating insights effectively
✔ Working under corporate workflow conditions
✔ Building a strong professional portfolio
✔ Facing interviews with confidence
✔ Operating independently in real company environments

These activities transform a technically trained individual into a professionally ready data candidate.

This is the final bridge between learning and employment.

Final Outcome – Corporate Readiness

After completing this Practical Activity-Based Mastery Program, interns will be able to:

✔ Work with structured and unstructured data
✔ Extract and manage data from databases
✔ Build corporate dashboards
✔ Perform statistical and business analysis
✔ Automate reporting processes
✔ Present insights confidently
✔ Clear Data Analyst, BI Analyst, and Entry Data Science interviews
✔ Operate independently in corporate environments
